

Day 4 - Python Basics: Dictionaries & Sets

■ Dictionaries (dict)

- Store key-value pairs. - Keys must be unique and immutable (str, int, tuple). - Values can be of any data type.

Code	Output
person = {"name": "Harshith", "age": 34, "city": "Bangalore"}	Dictionary created
person["age"]	34
person["dept"] = "Telecom"	Adds new key-value
person.pop("city")	Removes key "city"

■ Sets (set)

- Store unique, unordered items. - Useful for mathematical set operations (union, intersection, difference).

Code	Output
fruits = {"apple", "banana", "grape"}	{'apple', 'banana', 'grape'}
fruits.add("mango")	Adds new item
fruits.remove("banana")	Removes item
A B	Union of A and B
A & B	Intersection of A and B
A - B	Difference of A and B

■ Day 4 Mini Quiz Solutions

Q1 → b) Dict stores key-value pairs, Set stores unique values

Q2 → c) pop()

Q3 → b) {1,2,3}

Q4 → d) List

Q5 → b) {3}
