

Python Basics - Day 2 Notes

Topics Covered: Operators, Input/Output, String Methods, Membership Operators

1. Arithmetic Operators: +, -, *, /, //, %, **

Example: $a = 17, b = 5 \rightarrow a+b=22, a-b=12, a*b=85, a/b=3.4, a//b=3, a\%b=2, a**b=1419857$

2. Input/Output: input(), print(), f-strings for formatting

Example: `name = input('Enter name'); print(f'Hello {name}')`

3. String Methods:

- `strip()`: removes leading/trailing spaces
- `lower()`: converts to lowercase
- `upper()`: converts to uppercase
- `replace(old, new)`: replaces text
- `title()`: Capitalizes each word

4. Membership Operators:

- `'word' in string` → True if word exists
- `'word' not in string` → True if word does not exist

5. Example Programs:

- Mini Calculator (with +, -, *, /, //, %, **)
- Greeting with input()
- Clean string with `strip()` and count length

Practice Exercises:

- Even or Odd check
- Replace 'bad' with 'good'
- Sentence word search (Python vs Java)
